

MAST CELL DISEASE

is a group of diseases involving the
immune system

Patients can have **dangerous** and
life-threatening reactions
including **anaphylaxis**.

People of any age or
gender can develop a
mast cell disease.

It's often
UNRECOGNIZED and likely
UNDERDIAGNOSED

Symptoms are often
UNPREDICTABLE
in onset

Triggers that cause reactions can be numerous and often seem benign.

For about **75%** of patients, the ability to **work** or
participate in activities of daily living is decreased.¹
